

Atlanta Health EDA Report

Connecting community health burden, Medicare opportunity, and future CVS Health growth.

Executive Summary

This analysis moves from public health need to business opportunity. It first identifies the leading causes of death in Fulton and DeKalb Counties, then examines how those outcomes intersect with education, socioeconomic vulnerability, and race. The report then sizes the Medicare-age opportunity using age 65+ population, compares that opportunity to current Aetna Medicare Advantage enrollment, and closes with a CVS forecast that estimates potential value from targeted outreach.

1. Community Health Burden

The mortality analysis shows which conditions create the greatest burden across Fulton and DeKalb. Chronic diseases such as heart disease, stroke, cancer, and diabetes remain central to the story. NCHS is kept separate because its categories are not directly comparable to Georgia and OASIS.

2. Population Demographics

The demographic dashboards summarize race, sex, and leading cause distributions without overwhelming the reader with dozens of individual pie charts. Labels were moved to legends to improve readability and reduce overlap.

Sex Distribution: Georgia and OASIS

Race Distribution Dashboard

3. Social Determinants of Health

Education level and socioeconomic vulnerability help explain where the mortality burden is concentrated. These charts support the case for a targeted intervention rather than a broad, unfocused outreach campaign.

4. Interactive Visualizations

Interactive Plotly charts are generated in the **outputs/html** folder. The report does not include links here because relative links can break when the report is moved, zipped, downloaded, or opened outside the project folder.

5. Aetna Enrollment and Market Opportunity

The Aetna analysis compares known Medicare Advantage enrollment against the age 65+ population. This frames the difference between Aetna's current footprint and the broader Medicare-age population CVS could reach through prevention, care navigation, screening, and chronic disease support.

Note: Age 65+ population is used as a proxy for Medicare-age market size. Aetna enrollment reflects known enrollment only.

Aetna Penetration of the Age 65+ Population

6. CVS Health Care Benefits Forecast

The forecast section links the local opportunity back to CVS Health Care Benefits growth. Historical revenue provides the baseline, scenario forecasts show possible future trajectories, and the incremental Aetna opportunity chart translates potential capture rates into revenue impact.

CVS Health Care Benefits Historical Revenue

CVS Health Care Benefits Forecast Scenarios

Potential Incremental Aetna Revenue

7. Strategic Interpretation

The strongest finding is the overlap between community need and market opportunity. Communities experiencing high chronic disease burden are also the communities where CVS and Aetna could justify targeted outreach through screenings, food and nutrition support, medication adherence, transportation assistance, and care navigation. This creates a path to both health impact and measurable business value.
